

11-Magnetic Circuits

ECEGR 450
Electromechanical Energy Conversion

Overview

- Introduction
- Magnetic Circuit Assumptions
- Observations of Magnetic Circuits

Dr. Louie

2

Introduction

- Faraday's Law and Lorentz force equation are basis for electromechanical energy conversion
 - Both are dependent on flux or flux density
 - How can these quantities be computed for a given physical arrangement?

Dr. Louie

3

Magnetic Circuit Assumptions

- Let magnetic flux be set up by a coil of wire with dc current, i
- Current establishes flux ϕ in the core
- Let there be N turns of wire on the coil

Dr. Louie

4

Magnetic Circuit Elements

- Some flux does not pass through the core
 - leakage flux: ϕ_L
 - small compared to ϕ
- Leakage flux can be reasonably ignored

Dr. Louie

5

Magnetic Circuit Elements

Magnetic flux density may not be uniform in a cross sectional area

Dr. Louie

6

Magnetic Circuit Elements

- Fringing occurs in air gaps
- Flux density decreases (cross sectional area increases)

Rest of magnetic circuit not shown

Dr. Louie 7

Magnetic Circuit Assumptions

- Magnetic flux flows entirely through the magnetic material (no leakage)
- Magnet flux density is uniform throughout the cross section of the material
- Fringing across air-gaps is negligible

How realistic are these assumptions?

Dr. Louie 8

Magnetic Circuit Assumptions

Iron yoke with coil of wire

- $\mu_r = 4000$
- 50 A, single turn

yoke cross section

5cm
5cm
coil
1 cm
1 cm

Dr. Louie 9

Example Magnetic Circuit

H Field **|H|**

Iron core influences direction of **H** field

|H| decreases as distance from coil increases

Dr. Louie 10

Magnetic Circuit Assumptions

B Field **|B|**

Leakage flux density is small in magnitude

Flux density through the core is much larger than outside it

Dr. Louie 11

Magnetic Circuit Assumptions

|B| **|B|** down Z-axis at dashed line

Flux density is nearly uniform

Dr. Louie 12

Magnetic Circuit Assumptions

Iron yoke with coil of wire

- $\mu_r = 4000$
- 50 A, single turn

yoke cross section
1 cm
1 cm

5cm
4.5cm
vacuum
coil

Dr. Louie 13

Magnetic Circuit Assumptions

H Field

fringing

Dr. Louie 14

Magnetic Circuit Assumptions

- Assumptions hold reasonably well for magnetic circuits
- We next inspect magnetic circuits to develop a qualitative understanding of how B and H behave

Dr. Louie 15

Magnetic Circuit Observations

Flux density (flux) is less in a circuit with an air gap

Without air gap
With air gap

Note: circuits have same dimensions, zoom is different.

Dr. Louie 16

Magnetic Circuit Observations

Field intensity is low in iron (high permeability) and high in air gap (low permeability)

Without air gap
With air gap

Note: circuits have same dimensions, zoom is different.

Dr. Louie 17

Magnetic Circuit Observations

Which section(s) of this circuit is iron, and which is air?

Dr. Louie 18

Magnetic Circuit Observations

Which section of this circuit is iron, and which is air?

air

Also note: flux "prefers" path of high permeability.

Dr. Louie 19

Magnetic Circuit Observations

How does the flux density in this segment compare to the others?

Assume uniform depth

Dr. Louie 20

Magnetic Circuit Observations

Dr. Louie 21

Summary

- Basic assumptions for magnetic circuit analysis:
 - No leakage
 - Uniform flux density
 - No fringing across air-gaps
- Assumptions are reasonable for most magnetic circuits

Dr. Louie 22
