

22-Functions Part 1

text: Chapter 7.1-7.5

ECEGR 101

Engineering Problem Solving with Matlab

Professor Henry Louie

Overview

- Function Syntax
- Help Line
- Saving Functions
- Using Functions

Functions

- Function
 - A special type of m-file that runs in its **own independent workspace**.
 - It receives input data through a **input argument list** and returns results to the caller through an **output argument list**.
- Compare to built-in MATLAB functions ($\sin(x)$, $\log(x)$, $\text{mean}(x)$).

Function Example

Calculate the mean squared error (MSE) and the maximum absolute error (MAE) between two input vectors.

Function Example (cont.)

MSE is defined as

$$\text{MSE}(x, y) = \frac{\sum_{k=1}^N (x_k - y_k)^2}{N}$$

where N is the length of the vectors (they have to be of the same length)

MAE is defined as

$$\text{MAE}(x, y) = \max_k |(x_k - y_k)|$$

Function Example (cont.)

- We can calculate the MSE and MAE of two given vectors on the command line
or we can write a function that will calculate MSE and MAE for any two vectors...

Command Window

```
>>  
>> x = [1 5 7 9 11 0 3 4 6 8];  
>> y = [0 6 8 9 10 1 1 5 8 8];  
>> mse = mean((x-y).^2)  
mse =  
    1.4000  
>> mae = max(abs(x-y))  
mae =  
     2  
>>
```

```
1 function [mse, mae] = calculate_MSE_MAE(x, y)
2 % calculate_MSE_MAE computes MSE and MAE
3 % Function calculate_MSE_MAE computes the mean
4 % squared error (MSE) and the maximum absolute error
5 % (MAE) between two vectors.
6 % Input arguments:
7 % x - vector 1
8 % y - vector 2
9 % Output arguments:
10 % mse - the MSE between vectors x and y
11 % mae - the MAE between vectors x and y
12
13 d = x-y;
14 mse = mean(d.^2);
15 mae = max(abs(d));
16
```

$$\text{MSE}(x, y) = \frac{\sum_{k=1}^N (x_k - y_k)^2}{N}$$

$$\text{MAE}(x, y) = \max_k |(x_k - y_k)|$$

```
1 function [mse, mae] = calculate_MSE_MAE(x, y)
2 % calculate_MSE_MAE computes MSE and MAE
3 % Function calculate_MSE_MAE computes the mean
4 % squared error (MSE) and the maximum absolute error
5 % (MAE) between two vectors.
6 % Input arguments:
7 % x - vector 1
8 % y - vector 2
9 % Output arguments:
10 % mse - the MSE between vectors x and y
11 % mae - the MAE between vectors x and y
12
13 d = x-y;
14 mse = mean(d.^2);
15 mae = max(abs(d));
16
```

help text

function body

Function Definition Line

keyword
(required)

output arguments list

```
function [output arguments] = function_name(input_arguments)
```

name of the function

input arguments list

Exercise

Is this a correct function definition line?

Function [a] = area(w, h)

function [output arguments] = function_name(input_arguments)

Exercise

Is this a correct function definition line?

```
Function [a] = area(w, h)
```

Answer: **no**.

The keyword has to be typed in all small letters.

Exercise

Is this a correct function definition line?

```
function out = sqr_abs(x)
```

```
function [output arguments] = function_name(input_arguments)
```

Exercise

Is this a correct function definition line?

```
function out = sqr_abs(x)
```

Answer: **yes**.

If there is only one output variable, no square parentheses are needed.

Exercise

Is this a correct function definition line?

```
function y = sumSquaredElements([1 2 3])
```

```
function [output arguments] = function_name(input_arguments)
```

Exercise

Is this a correct function definition line?

```
function y = sumSquaredElements([1 2 3])
```

Answer: **no**.

The list of input arguments must contain variables not values.

Exercise

Is this a correct function definition line?

```
function x = randomInt()
```

```
function [output arguments] = function_name(input_arguments)
```

Exercise

Is this a correct function definition line?

```
function x = randomInt()
```

Answer: **yes**.

Function may not have any input variables.

Exercise

Is this a correct function definition line?

```
function plotResults(x1, x2)
```

```
function [output arguments] = function_name(input_arguments)
```

Exercise

Is this a correct function definition line?

```
function plotResults(x1, x2)
```

Answer: **yes**.

Functions do not need to have any output variables.

The H1 Line

- First comment line
- Used by the `lookfor` command in MATLAB:

Command Window

```
>> lookfor mse  
calculate_MSE_MAE computes MSE and MAE  
OPTIMSET Create/alter optimization OPTIONS structure.
```

The Help Text

- Comment lines starting just after the H1 line and ending with an empty line.
- Explain the function and its input and output variables.
- Displayed when `help function_name` is typed.

```
Command Window
>> help calculate_MSE_MAE
calculate_MSE_MAE computes MSE and MAE
Function calculate_MSE_MAE computes the mean
squared error (MSE) and the maximum absolute error
(MAE) between two vectors.
Input arguments:
x - vector 1
y - vector 2
Output arguments:
mse - the MSE between vectors x and y
mae - the MAE between vectors x and y
```

Function Body

- Contains **computer program** (MATLAB commands) that performs the calculations (or plots something, saves values to a file, etc)
- The commands in the function body have to **assign values to the output arguments**
- New variables can be created within the function body

Exercise

What is wrong with the following function?

```
1 function x = randomInt()  
2 % Output a random 8-bit integer.  
3  
4 - y = int8(10*rand);  
5
```

Exercise

What is wrong with the following function?

```
1 function x = randomInt()
2 % Output a random 8-bit integer.
3
4 - y = int8(10*rand);
5
```

Answer: the function body never assigns a value to the output variable x.

Exercise

What is wrong with the following function?

```
Editor - C:\Documents and Settings\amigu...
File Edit Text Cell Tools Debug Desktop Wind
[Icons]
1 function x = randomInt()
2 % Output a random 8-bit integer.
3
4 - y = int8(10*rand);
5
```

Command Window

```
>> z = randomInt
```

```
??? One or more output arguments not assigned during call to 'C:\Documents and Setting
```

Saving a Function File

- Use the same file name as the function name.
- The file extension has to be “.m”.

```
C:\Users\agnieszka\Documents\ECEGR 101\LECTURES\CHAPTER 6\calculate_MSE_MAE.m
File Edit Text Go Cell Tools Debug Desktop Window Help
[Icons] Stack:
- 1.0 + ÷ 1.1 x % %
1 function [mse, mae] = calculate_MSE_MAE(x, y)
2 % calculate_MSE_MAE computes MSE and MAE
3 % Function calculate_MSE_MAE computes the mean
4 % squared error (MSE) and the maximum absolute error
5 % (MAE) between two vectors.
6 % Input arguments:
```

The above function has to be saved in a file
calculate_MSE_MAE.m

Using a Function File

- Type the function name in the Command Window. Include input and output variables.
- Example:

```
Command Window
>> x = [1 5 7 9 11 0 3 4 6 8];
>> y = [0 6 8 9 10 1 1 5 8 8];
>>
>> [m1, m2] = calculate_MSE_MAE(x,y);
>>
>> m1
m1 =
    1.4000
>>
>> m2
m2 =
     2
>>
```

Using a Function File

Command Window

```
>> [mse, mae] = calculate_MSE_MAE([1 2 3 4], [0 1 2 3]);  
>>  
>> mse  
mse =  
     1  
>>  
>> mae  
mae =  
     1  
>>
```

Using a Function File

```
Editor - C:\Documents and Settings\amigue...
File Edit Text Cell Tools Debug Desktop Wind
[Icons: File, Folder, Save, Cut, Copy, Paste, Undo, Redo, Print, Help, Find]
1 function x = randomInt()
2 % Output a random 8-bit integer.
3
4 - x = int8(10*rand);
5
```

```
>> b = randomInt
b =
5
```

```
>> randomInt
ans =
6
```

```
>> c = [randomInt randomInt randomInt]
c =
9 9 3
```
